

# BFIC MAINNET

THE EXCELLENCE OF SCALABILITY & UTILITY

- 01 Challenge
- 02 Solution
- 03 Features
- 04 Technology
- 05 Ecosystem
- 06 Tokenomics

## TO RESOLVE **THE LIMITATIONS** OF **LAYER 1 EVM CHAIN**

### User Experience Flaws

Excessive gas fees & proof-of-work limitations

### Constrained Throughput

Low Transaction speed & throughput are an obstacle in scalability.

### Dependency & Risks

Governance dependence, shared throughput and clogging risks

Ethereum's powerful and thriving ecosystem is a favorite amongst blockchain developers, yet it comes with a set of limitations without any particular framework for mitigation & improvements. Hence, creating a critical development challenge and fragmentation in the ecosystem.

## BFIC MAINNET

A CROSS-CHAIN PROTOCOL TO BRIDGE ETHEREUM  
COMPATIBLE BLOCKCHAINS WITH OTHER BLOCKCHAIN NETWORKS

Interoperability protocol for arbitrary communication  
between Ethereum & other blockchain networks

Instant deployment of all  
current blockchains

Regularly evolving modules for  
custom network development

Adaptor modules for interoperability  
between existing blockchains

Modular Security & Optional  
Security as a Service

## FEATURES

BFIC IS A **DEVELOPER-FRIENDLY PROTOCOL** THAT COMBINES THE BEST FEATURES OF LAYER 1 AND SOVEREIGN BLOCKCHAINS.

### ETH Compatible

Perks of pre-established tools, standards, tech stacks and global acceptance

### Scalability

Scalable consensus algorithms, dedication blockchains & custom execution environments

### Security

Scalable consensus algorithms, dedication blockchains & custom execution environments

### Sovereign Governance

Sovereign governance with customizable tech stack and dedicated resources

### Interoperability

Arbitrary communication support for contract calls, tokens etc.) & bridging to and from external systems.

### Customizable

Extensibility, flexible customization, community collaboration & easy to upgrade

### Enhanced Experience

### Development Friendly

Ethereum equivalent with no requirement of permissions, fees or token deposits.

### User Friendly

Instant transactions, Web 3.0 support & zero gas fee

# THE TECHNOLOGY

BFIC Blockchain is equipped with the core tools and components that are essential to build a borderless economy.

The BFIC protocol combines the developer experience, interoperability & security of Ethereum with optimized features of numerous stand-alone blockchains to add sovereignty, flexibility and scalability. This provides an exceptional compatibility with the current Ethereum components and enables communication between Ethereum and sovereign blockchains.

## Framework

Deploy Ethereum-compatible presets with one click.

Expandable developer modules to integrate consensus, dispute resolvers, governance, staking and EVM/Ewasm for custom blockchains.

## Protocol

Arbitrary communication between any two BFIC chain participants, or between BFIC and Ethereum protocols.

Module Security as a service provided either by dedicated validators or by Ethereum.

# SUPPORTED CHAINS

## Stand-alone Chains

Ethereum-compatible blockchains that are responsible of their own security. With their own dedicated pool of validators, these blockchain networks are more independent and flexible.

Enterprise  
Networks

Community  
Projects

## Secured Chains

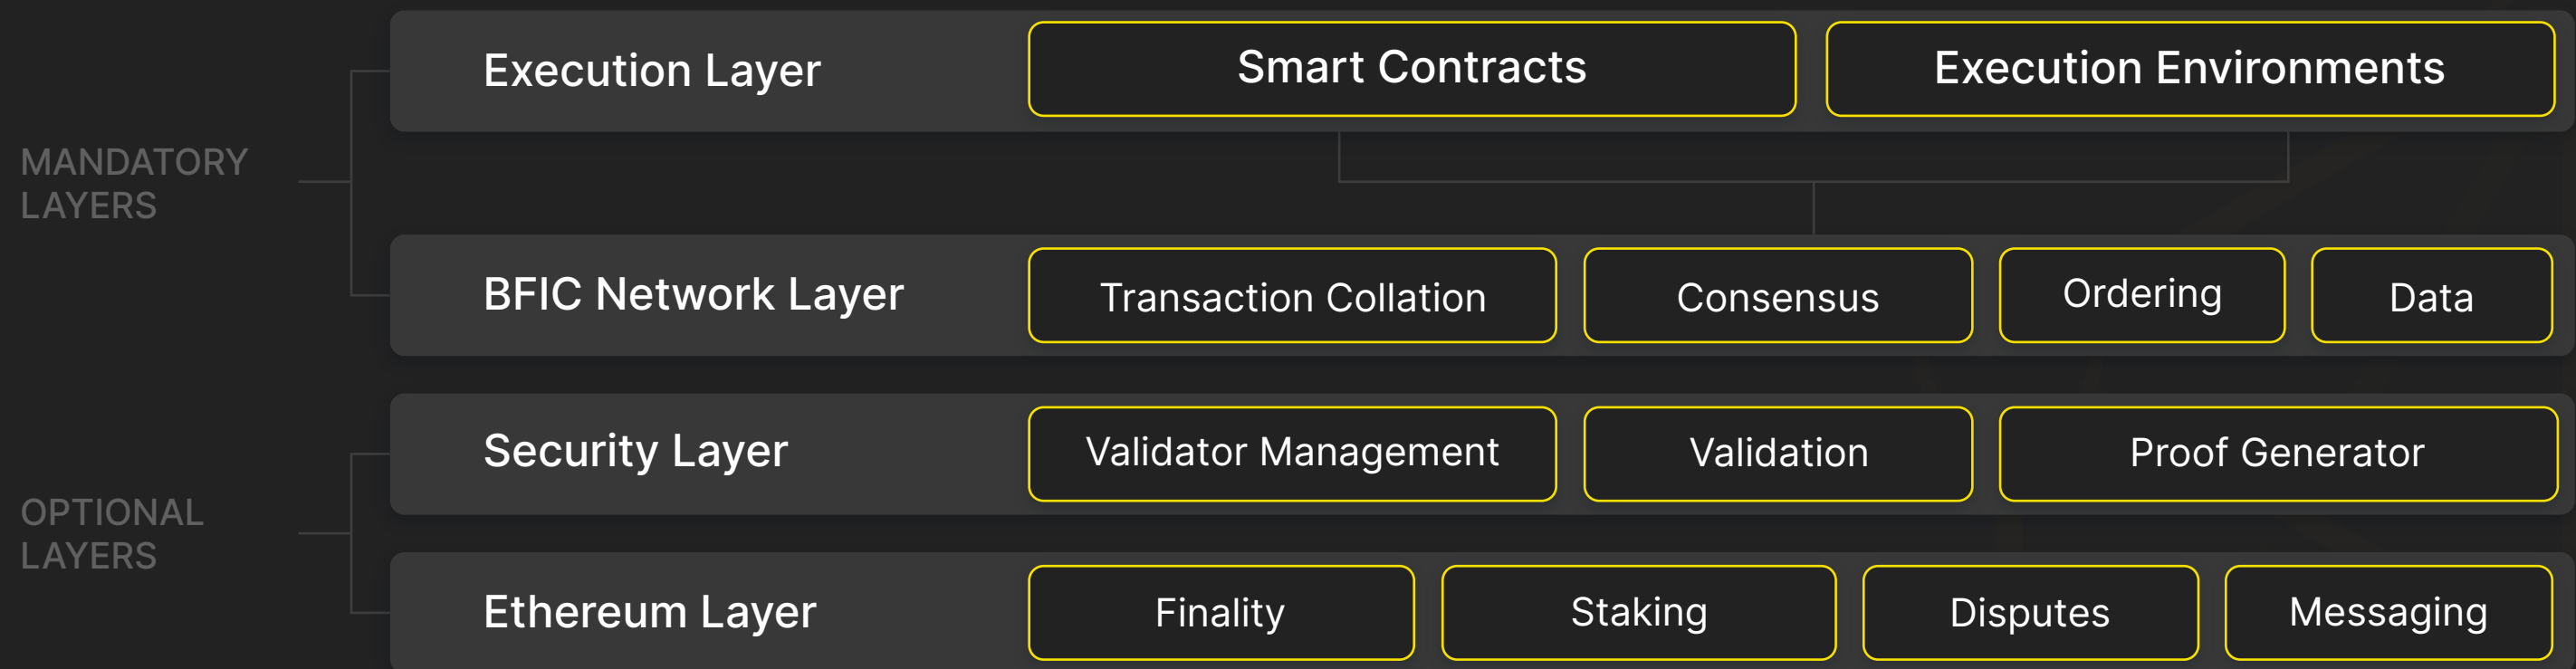

Blockchain networks that rely on external “security as a service”. Secured chains either use Ethereum’s security protocols or use professional validators such as Polkadot’s “shared security”. Secured chains are more flexible and secure.

Startup  
Projects

Security  
Focused  
Projects

# THE **ARCHITECTURE**

## **EXECUTION LAYER**

The execution layer interprets and executes BFIC network blockchains' confirmed transactions. It is resolved in to 2 sub-layers:

### **Environment Layer**

pluggable virtual machine implementation

### **Logic Layer**

logics and state transitions of BFIC network, interpreted as Ethereum smart contracts

## BFIC NETWORK LAYER

A combination of sovereign blockchain networks. Each network maintains specific functions to serve its community.

Transaction Collation

Block Production

Local Consensus

## SECURITY LAYER

An optional layer responsible to provide validation and security. A constellation of validators to validate BFIC chain transactions for a fee. The security layer maybe implemented alongside Ethereum to perform the following functions:

Validator Management

BFIC Chain Management

## ETHEREUM LAYER

Ethereum, the most secure programmable blockchain can also be utilized as an option to execute critically essential components of BFIC Chains. Implemented as Ethereum smart contracts, this layer hosts & performs functions such as:

Confirmation/Finality

Dispute Resolving

Communication between BFIC chains & Ethereum

Staking

## WEB 3.0

The BFIC protocol is a user-friendly platform that supports development for the Web 3.0 space. Developers enjoy predefined assets & tools to design and write applications for deployment on the BFIC blockchain.

## METaverse

Augmented/Virtual reality is the next big thing in the digital world. The BFIC Blockchain supports AR/VR application for Metaverse platforms.

## SMART CONTRACTS

The BFIC Network is compatible with (EVM) Ethereum Virtual Machine. This enables developers to deploy an Ethereum smart contract on the BFIC Network.

## GAMING

Smart Contracts on the BFIC Network can be utilized by game developers to create and deploy in-game collectibles, items, trading cards and any decentralized gameplay inventory or environment.

## DEX

The BFIC protocol can host DEX platforms that facilitate the decentralized transit of tokens deployed on Ethereum or BFIC Blockchain. This can be achieved via Automated Market Maker or ERC-20 smart contracts.

## NFT

Non-Fungible Tokens (NFTs) can be deployed on and transferred to & from the BFIC Network using BFICoin. Ethereum compatible NFT assets can be bridged through BFIC Network.

## THE TOKENOMICS

BFICoin is the native token of BFIC Blockchain. Its purpose is to reward miners and validators for adding blocks to the blockchain and as a payment medium for transaction fees. BFICoin will also act as the core transaction instrument for the entire BFIC ecosystem.

## MAXIMUM SUPPLY

The maximum supply of BFICoin is set to be 21 million tokens only. This makes the scarcity of BFICoin equal to that of Bitcoin.

## SUPPLY DISTRIBUTION

The chart and the figures below reflect the distribution allocation of BFICoin's total supply.

**02%** EMERGENCY FUND

**02%** BOUNTY

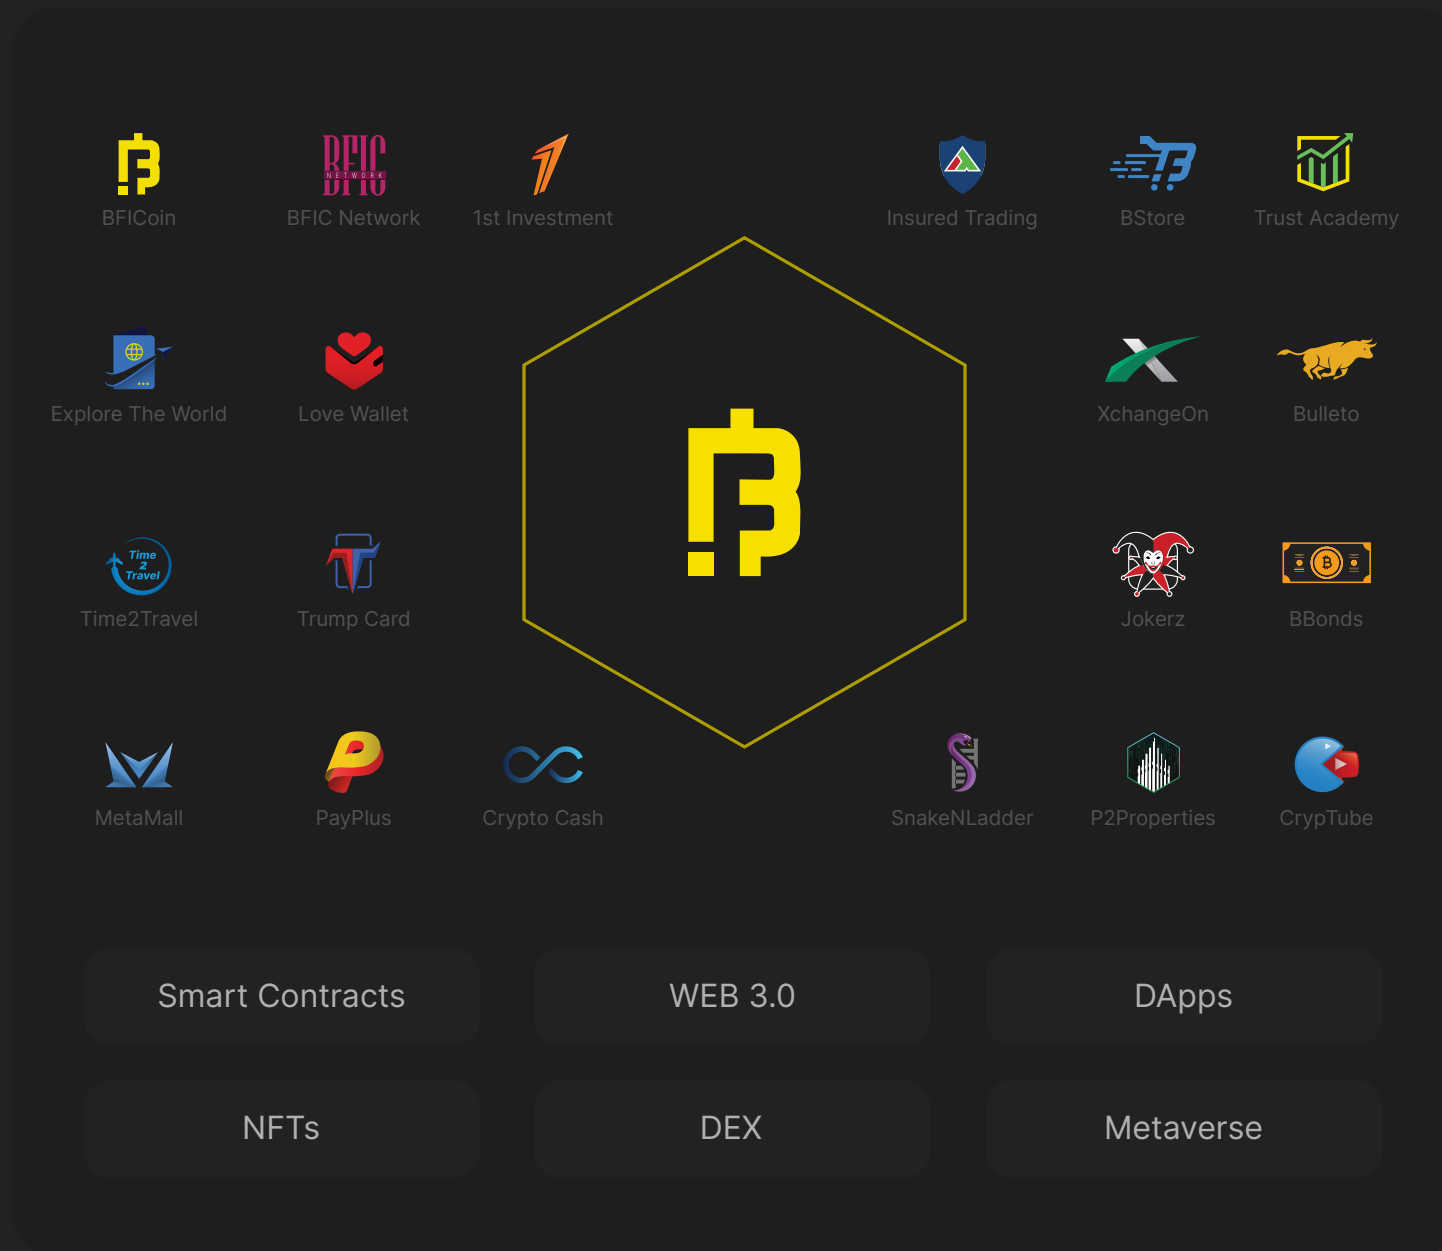

**03%** SERVER MAINTENANCE

**03%** RESEARCH & DEVELOPMENT

**05%** ICO, IEO, AIRDROPS

**75%** REWARDS

**10%** TEAM

## THE UTILITIES & ASSOCIATES

The BFIC Blockchain can support NFTs, Smart Contracts, Web 3.0, Metaverse & DeFi platforms. BFICoin will gain utility in each of these formats.

**20** PLANNED UTILITIES

**06** LIVE UTILITIES

**12** UPCOMING UTILITIES

## THANK YOU

Visit the official website to learn more about BFICoin, its listings, utilities and future roadmap.
